

CSE222-HW8 REPORT

Elifnur Kabalcı

1801042617

ABOUT SEE FILES:

In the location I have sent in the file, vs code also sees txt files on my computer. That's why I sent it that way.

GRAPH CLASS

This class is my main class. Main is here. I get filename from user and generate map object. I'm checking if the start or end points are not 0. Thus, if there is such an error, the program closes without running at all. Then the graph object is generated and the map object is embedded in the graph. I have defined the edge arraylist. My initial thought was to keep the 0 coordinates at the edge and run the algorithms accordingly, but I could not integrate the algorithms that should be used. So I assigned map I in the map object to edge. Then I ran the algorithms one by one. While BFs was running, I commented out Dijkstra's lines. Thus, I tried to reduce the time that occurs in Dijkstra. First of all, I printed the shortestPath coordinates to the screen for testing. Then I transferred this data to txt files containing outputs. With the help of a filewriter, I transferred the name to the file being read and the file specific to the method used.

MAP CLASS

Here, I read the file requested by the user to be examined and transferred it to a data storage tool. In this part, I used 2d int array. I also recorded the start and end positions in this section.

BREATHFIRST CLASS

I sent the start coordinate, end coordinate and map I used to this class. Here is the method written for the path finding algorithm.

First of all, I defined a 2d array to hold the previous nodes and filled it with -1. Thus, if there is no data entry, we can understand that nothing happened before. We assigned the start to the queue we defined and gave -2 to the previous one. What makes this special is to make the program stop when it sees the node whose previous u was -2. We checked if it was valid by visiting the queue one by one and checking its neighbors. Thus, the design of the queue was completed. Then I tried to find the shortest path from this queue. For this, the while in control statement became the predetermined number of -2.

DIJKSTRA CLASS

This is the part I had the most difficulty with. Because no matter how hard I tried, instead of printing the whole path, it went to the direct end node and did not create a path. The main thing in this algorithm is to find the values with the minimum distance between the given coordinates. I didn't say the ready node patterns first, but it didn't connect the currentnode to the previousnode. I tried removing the node build completely but got the same result in it. Then I defined the node structure myself and implemented the data myself. This time the previousnode worked fine.

TEXTTOIMAGE CLASS

In this part, I used more ready-made molds. While creating the object, I sent the positions of the txt and png as parameters. Then I sent the shortest path list to convert it to png with the turned method and draw a path.

OUTPUT GENERATION

I have prepared output files. These files show the coordinates of the path followed. I got the filename from the user. When we write "map01", "map01 + (name of search algorithm) + output.txt" is given. I did not give the file name or output name in main. All can be changed. I give the coordinate values in the file. So I also suppressed the number of steps as output to the terminal. And for each txt file I printed it to the screen. Since the files from 1 to 10 are 500 in size, I continued by defining direct 500, however. When I switched to specific maps, I used 1000 instead of 500 in the definition in the map class because of their size.

BFS OUTPUTS:

```
11:00:37 PM C:\Users\kabalci>java -jar bfs_020101.jar

Running time: 38 milliseconds

```

```

Enter a filename: pisa.txt
BFS # of steps: 1130
Running time: 262 milliseconds
Dijkstra # of steps: 1130
Running time: 240 milliseconds

```

```

Enter a filename: tokyo.txt
BFS # of steps: 1157
Running time: 193 milliseconds
Dijkstra # of steps: 1157
Running time: 187 milliseconds

```

```

Enter a filename: triumph.txt
BFS # of steps: 1543
Running time: 223 milliseconds
Dijkstra # of steps: 1543
Running time: 300 milliseconds

```

```

Enter a filename: vatican.txt
BFS # of steps: 1826
Running time: 205 milliseconds
Dijkstra # of steps: 1826
Running time: 213 milliseconds

```

Map01-> dijkstra, map02->bfs, map03-> bfs, map04->dijkstra, map05->bfs, map06->bfs, map07->dijkstra, map08->bfs, map09->bfs, map10->dijkstra, pisa->bfs, Tokyo->dijkstra, triumph->bfs, Vatican->bfs

There are best solutions for my code. In general, according to the given maps and my code, there are 9 bfs and 5 dijkstra. Based on this, we can say that bfs does a better job on these maps.
